# 1 Introduction

## 1.1 Object Design Trade-offs

### 1.1.1 Buy vs. Build

The decision to Buy vs Build can be made by:

- If it is possible for the software to be built within a reasonable time frame using little resources, it is better to build than buy.

### 1.1.2 Space vs. Speed

In the Track and Control System, space is not a major priority. With only settings and some other menial data being kept, speed is the most crucial; as a fluid motion experience is what it is striving for.

### 1.1.3 Delivery Time vs. Functionality

If the development of TACS is behind schedule, the more in-depth functionalities can be sacrificed at little expense to the overall project.

### 1.1.4 Delivery Time vs. Quality

If testing runs behind schedule, the software can still be released and updates can be released to fix bugs at a later date.

### 1.1.5 Files vs. Databases

Files would not be as beneficial as a database because the data for TACS is not voluminous. A database would provide a sufficient structure to organize users and their settings. In using a file, users can theoretically edit and thus corrupt the file and the data inside. An "off site" database would be more secure and less likely to be modified.

## 1.2 Interface Documentation Guidelines

Classes

- Class names should be in Pascal Case.
- i.e.: MoveWindow

Constants

- All constants should be entirely in Upper Case.
- i.e.: RESOLUTION

Identifiers

- Identifier names should be in Camel Case.
- i.e.: xPosition, yPosition, userSpeed

Local Variables

- Variables should be all lowercase, less than 8 characters long.
- i.e.: speed

## 1.3 Definitions, Acronyms, and Abbreviations

- Application Specific Definitions
  - TACS - Track and Control System
  - TM - Tracking Module
    - \* OT - Object Tracker
    - \* FRT - Facial Recognition Tracker
  - WCM - Windows Control Module
    - \* WGO - Windows Grid Organizer
    - \* WP - Windows Perspective
  - SM - Settings Module
- Industry Definitions
  - SRS - Software Requirements Specification
  - OpenCV - Open Computer Vision: An open source library for object tracking via the camera.
  - SQLite - A lightweight, low maintenance, self contained local database.
  - DB - Database
  - RGB - Red, Green, Blue color values.
  - HSV - Hue, Saturation, Value.
  - API - Application Programming Interface
  - C++ - An object oriented programming language.
  - GUI - Graphical User Interface
  - QT - An API for building GUIs

## 2 Packages

### 2.1 Package Diagram

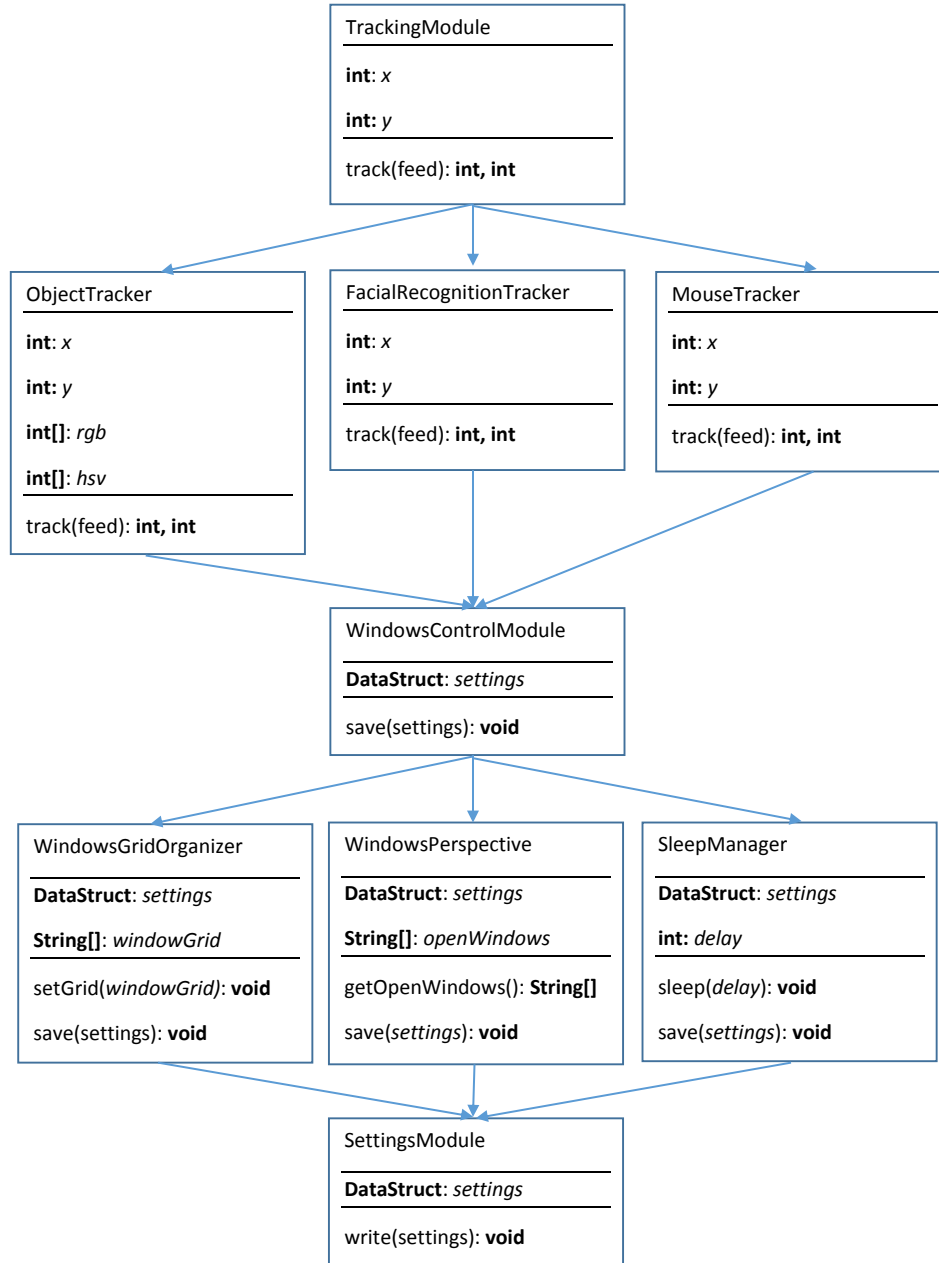

### 2.2 Package Definition

This software only has one package. This package is going to contain 1 main class and 8 subclasses.

## 3 Class Interface

### 3.1 Class Diagram

### 3.2 Decomposition Description

### 3.3 Class Definition
